Assignment Cover Page

⚠ **Important**

Ensure that you have read and understood the academic integrity policy and late submission guidelines found here.

1. The assessment task constitutes **15%** of the learning unit's final mark.
2. The submission deadline for this task can be found in BrightSpace.
3. Use of AI tools **is allowed** (refer to the Scope of Use of AI). Please adhere to Guidelines on assessment involving use of AI tools when submitting your work. You need to declare the use of AI tools in your submission.
4. The mode of submission is described in the subsequent pages.
5. Cater sufficient time to upload and to check through your submission.

Scope of Use of AI

This section seeks to clarify the use of AI allowed for this assignment.

(A) AI is allowed to assist you in:

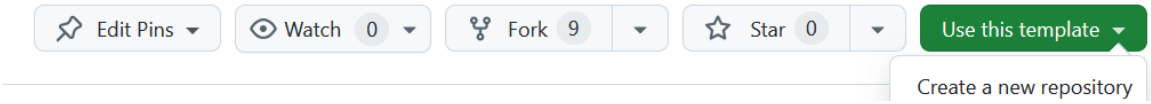

- Generating ideas for the application
- Generating mock data required for the node module
- Generating mock schema required for the node module

(B) AI is NOT allowed in the following situations:

- Generating codes
- Writing feedback for your friends

Assignment 1 (15%)

1. Visit https://github.com/nyp-dime/webapi-assignment1 and create a new repository using this template. This will be the basic code structure required for this assignment. Rename the template node module as **<your name>_<node module name>.js.** You may keep this repository as private first. Eventually you will need to change it to public for the purpose of this assignment.

   You may wish to revise the use of GitHub or GitHub Desktop.

2. Find an existing web application that is related to the sustainability, digital media or entertainment industry. Put the link of the web application in the references section.

3. The purpose of the assignment is to create a node module for the application that you have identified.

   Some suggestions:
   - E-waste recycling manager: Log drop-off points, rewards points calculations, and recycling quotas.
   - EV charging station tracker: Manage station availability, charging queues, and power usage.
   - Content subscription manager: Handle user access tiers, billing cycles, and paywall access rights.
   - Digital asset organizer: Manage the storage, cataloging, and license expiration tracking of stock images and video clips.
   - Event ticketing and seating planner: Handle concert ticket sales, seat selections, and early-bird discounts.
   - Theme park ride queue manager: Track current ride wait times, express pass entries, and maintenance statuses.

   If you require any “database”, you can use an array to simulate the storing and retrieval of dummy data.

4. Your node module should support at least 5 functions that are meaningful and realistic and relevant to the web application that you have identified. You should export the node module at the end of the file.

5. You **are not required** to provide a menu-driven application that is like Lab 5.

6. In the readme file, declare any use of AI and put in any references that you have used to support your assignment. Instructions on writing a readme file is inside the provided readme file.

7. Create a video recording (up to 2 minutes) to demonstrate and explain the features of your node module.

   You can use Clipchamp, Xbox game bar, Windows snipping tool, Loom or any other suitable tools to capture the video. While displaying your face is not required, it is essential that your voice remains clearly audible.

8. Critique on your friends' assignments. You should provide **constructive feedback**, via Brightspace discussion forum, for at least 2 other friends.

   Share your thoughts on the video and node module and suggest one specific improvement with examples.

9. The deadline and link to discussion forum can be found on **Brightspace → Assignment → Assignment 1**.

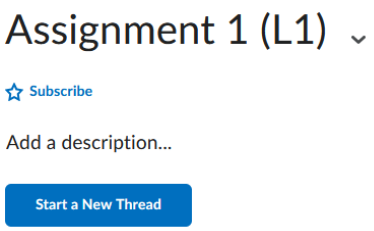

10. **Mode of submission**:
    a) Make your repository **public** by going to the repository's settings.

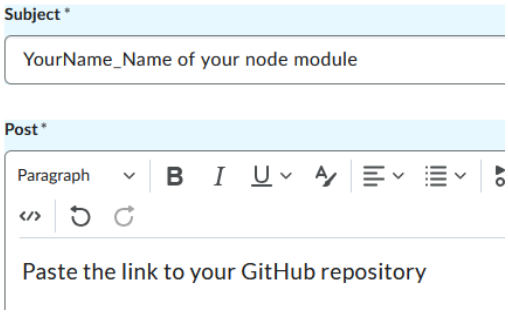

Look at the following screenshots on how to **post** on Brightspace discussion forum. **Follow the instructions carefully** to prevent any loss of marks due to carelessness.

Disclaimer: The following screenshots are taken with reference to the class "L1". It will be same process for L2.

    b) Start a new thread to submit your assignment

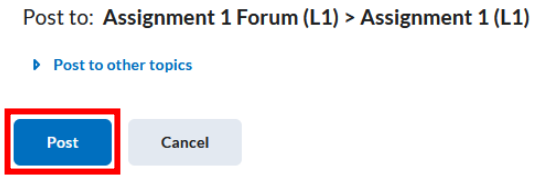

c) Type **your name and your node module name** as the thread's name. **Paste the link to your GitHub repository** in the contents. Double check that the link is functional, and you should be able to access the repository without logging in to your GitHub account.

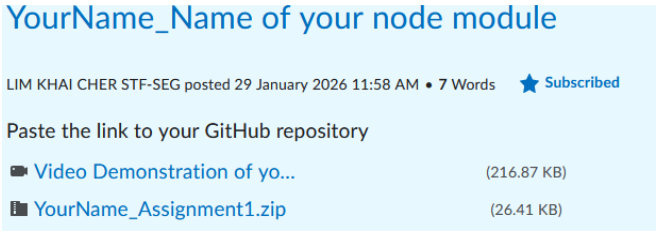

d) Upload **your video** (up to 2 minutes) and **a zip file containing your codes**. The tutor will use these files for assessment.

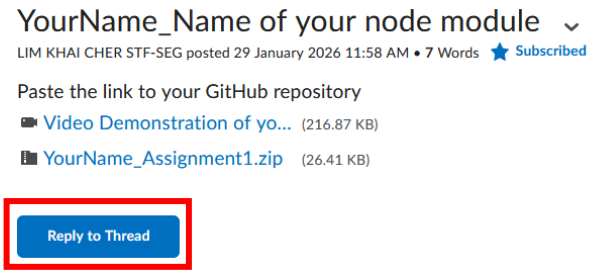

e) Publish the thread.

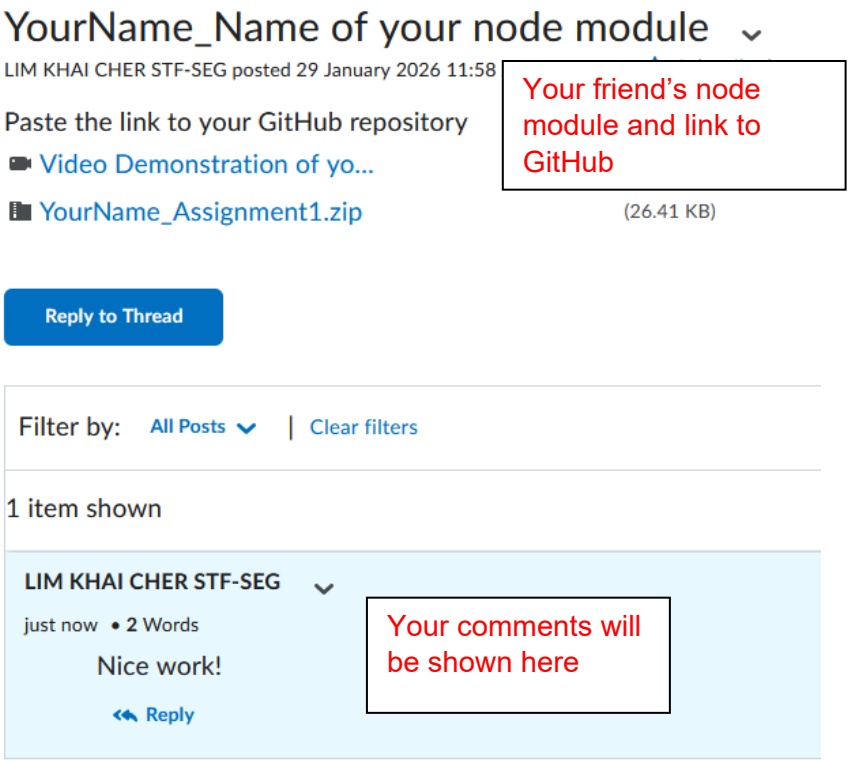

f) Click on the name of thread to share feedback by replying to the thread.

g) Share your constructive feedback for your friends' assignments. Share your thoughts on the video and node module and suggest one specific improvement with examples.

Marks will be awarded for students who provide <u>constructive</u> feedback.

EGL301 Assignment

Marking Scheme

1. Functionality of node module (35%)
    a. Creativity of the functions
    b. Relevancy of the module
    c. Relevant references

2. Video Demonstration (35%)
    a. Quality & Presentation
    b. Technical Communication

3. Critique of assignments (30%)
    a. Quality of constructive feedback

The module tutor reserves the right to question you on your work done. Your marks will be penalized if you are unable to explain your work done.
